DATA ANALYTICS PORTFOLIO · 2026

BlinkIT Business Analysis *Retail Sales & Outlet Performance* SQL (MySQL) | Power BI Qevin Attaqwa

A comprehensive analysis of BlinkIT's grocery sales data using **SQL (MySQL)** and **Power BI** — transforming transactional data into actionable insights on sales performance, customer satisfaction, product contribution, and outlet characteristics.

PROJECT OVERVIEW

What This Analysis Covers

This portfolio project evaluates BlinkIT's business performance across six key dimensions, producing an interactive Power BI dashboard supported by SQL-based analysis and business recommendations.

Sales Performance

Total revenue, average sales, and item volume across outlet types and locations

Customer Satisfaction

Average product ratings segmented by category, outlet type, and fat content

Product Categories

Top-performing categories by sales contribution, average sales, and item volume

Outlet Analysis

Impact of outlet size, type, establishment year, and location tier on performance

OVERALL KPIS

Business Performance at a Glance

BlinkIT generated **1.20 million in total sales** across 8,523 items, with an average sales value of **140.99 per item**. The overall customer rating of **3.97 out of 5** indicates strong baseline satisfaction, while the gap to a perfect score signals opportunity for improvement.

1.20M

Total Sales

Overall revenue generated from all items sold

140.99

Avg. Sales

Average revenue per item across all outlets

8,523

Items Sold

Total items recorded in the dataset

3.97

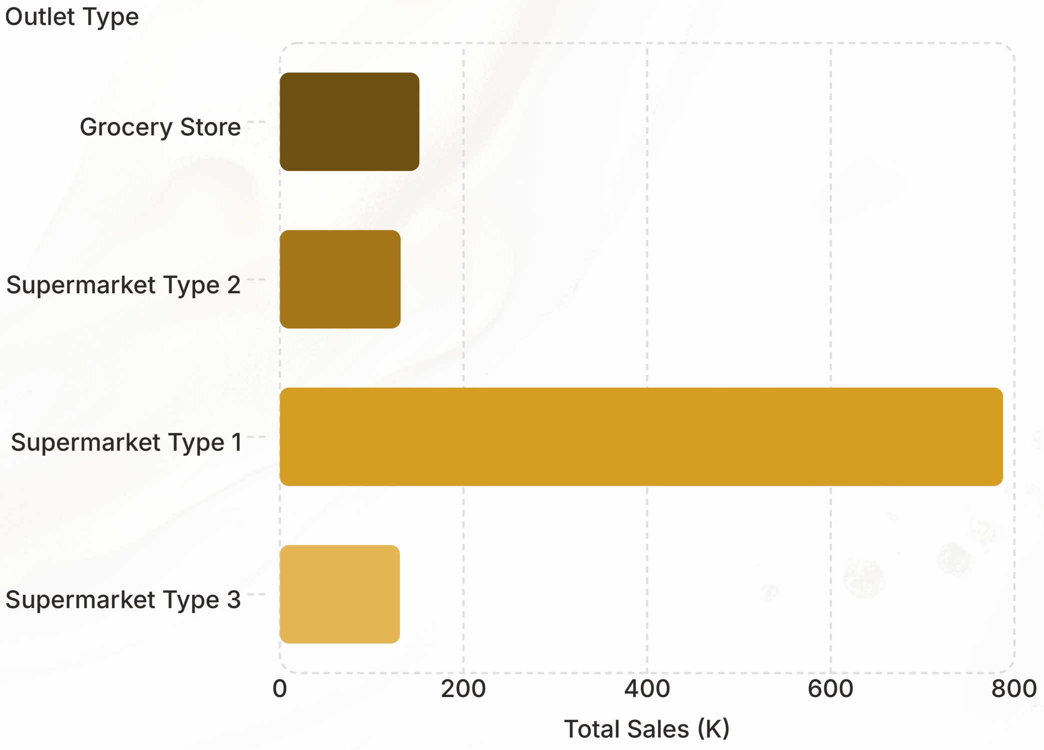
Avg. Rating

Customer rating out of 5 — a strong satisfaction baseline

These KPIs serve as the benchmark for comparing outlet types, location tiers, product categories, and fat-content segments throughout the analysis.

OUTLET ANALYSIS

Sales Performance by Outlet Type



Supermarket Type 1 Dominates

Supermarket Type 1 generates **0.79 million** — over 65% of total sales — supported by **5,577 items**, the highest item volume of any outlet type.

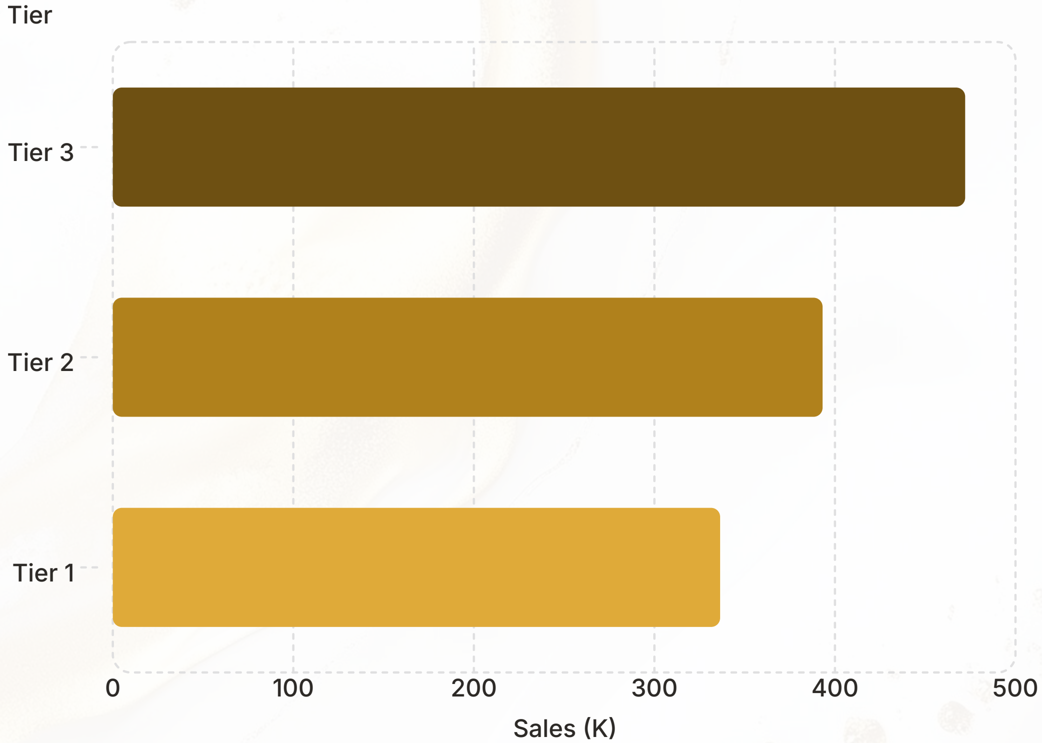
Average sales across outlet types are tightly clustered (139.80–141.68), indicating that **item volume, not average sales per item, is the primary differentiator** in total sales performance.

- **Grocery Stores** lead in customer rating at **3.99**
- **Supermarket Type 2** achieves the highest average sales at **141.68**
- **Supermarket Type 3** has the lowest rating at **3.95** — a target for improvement

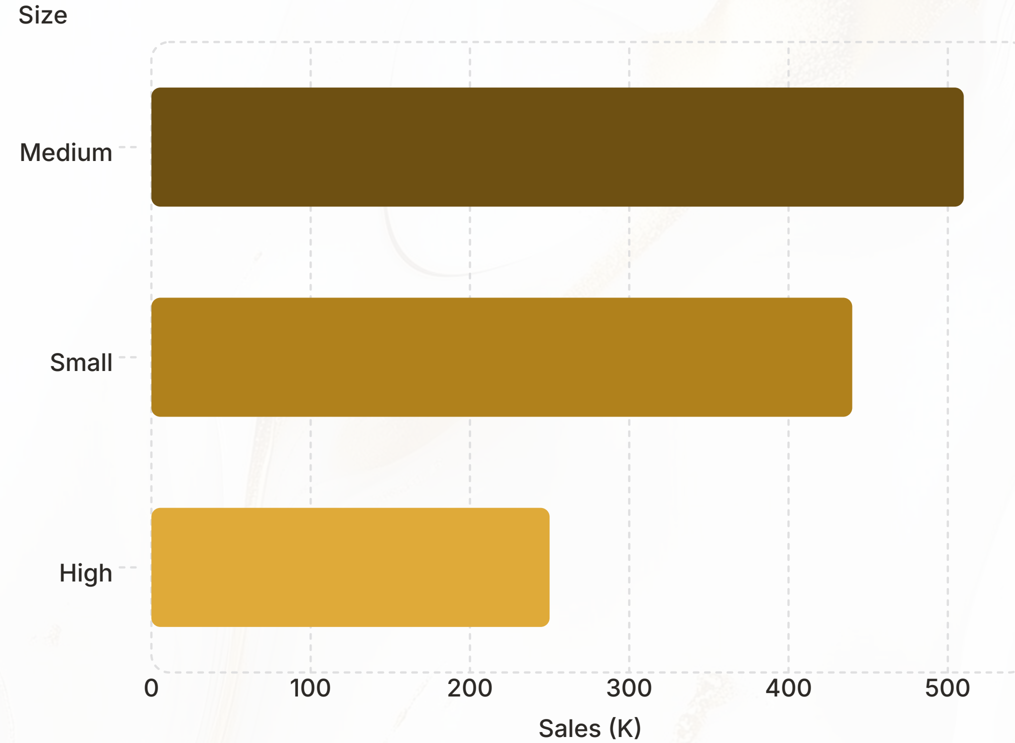
LOCATION & SIZE

Location Tier & Outlet Size Impact

Sales by Location Tier



Sales by Outlet Size

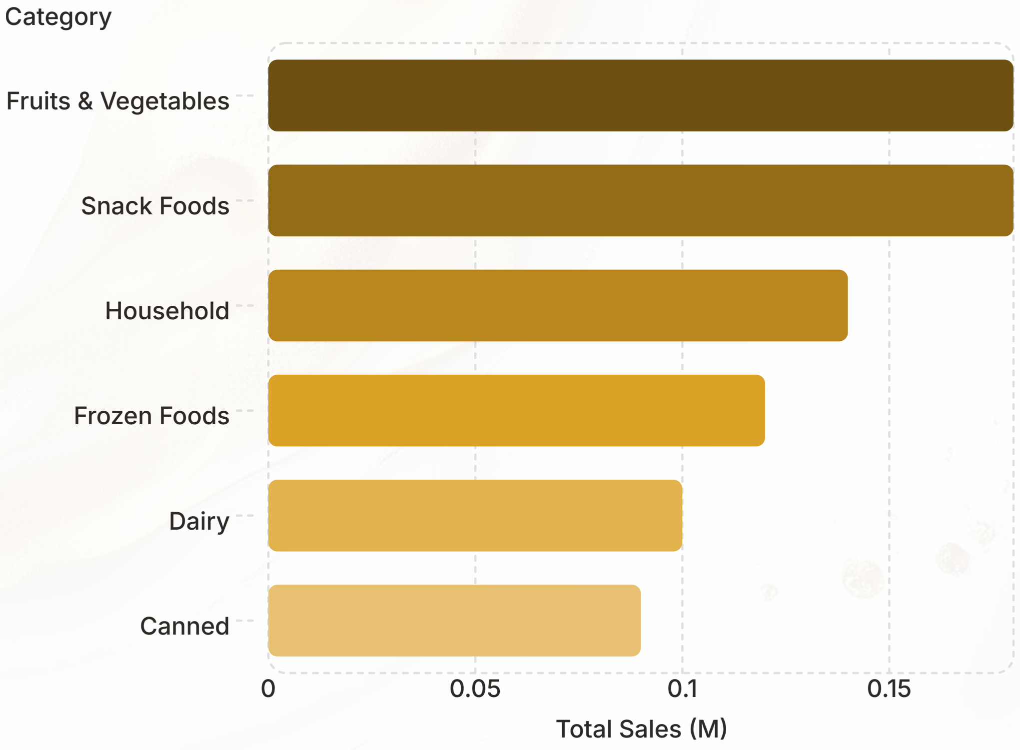


Tier 3 locations generate the highest sales at **0.47 million** with 3,350 items, while **Medium-sized outlets** outperform High-sized ones at **0.51 million** vs. **0.25 million**. In both cases, higher total sales are driven by **item volume, not higher average sales per item**. Average sales are nearly identical across tiers (140.87–141.17) and sizes (139.88–142.04).

Bigger outlets and higher-tier locations do not automatically produce higher revenue — Higher total sales are primarily associated with higher item volume in this dataset.

PRODUCT CATEGORIES

Top-Performing Product Categories



Volume Drives Category Leadership

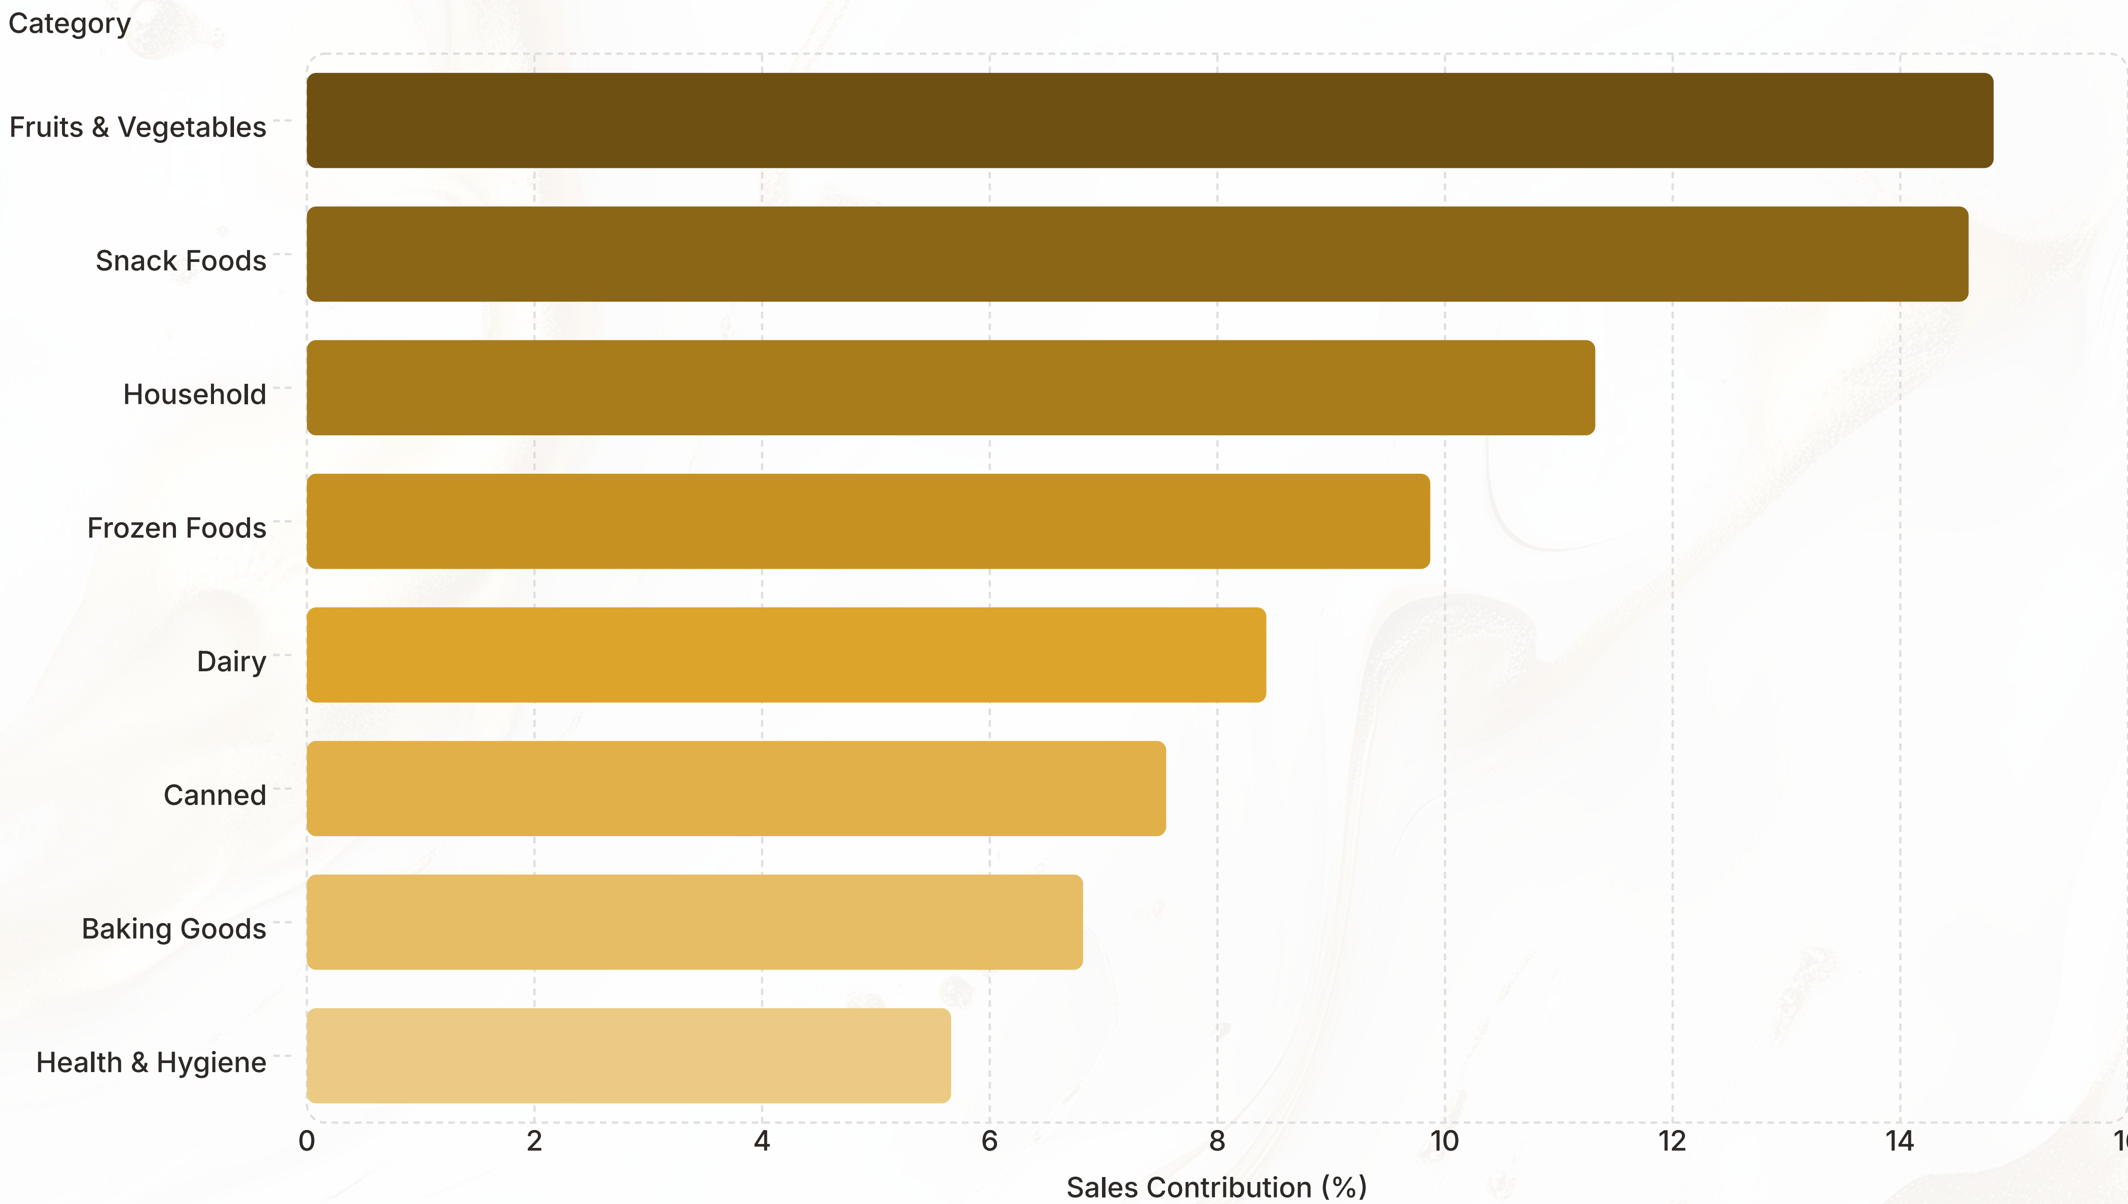
Fruits and Vegetables and **Snack Foods** lead total sales at **0.18 million each**, supported by the highest item volumes — 1,232 and 1,200 items respectively.

However, **Household** stands out on efficiency: it achieves the highest average sales at **149.42** and maintains a strong **4.00 rating** despite lower item volume (910 items).

Meat holds the highest customer rating at **4.02**, while **Breads** records the lowest at **3.88** — a category warranting quality review.

REVENUE CONCENTRATION

Sales Contribution by Product Category



The top three categories — **Fruits & Vegetables (14.82%)**, **Snack Foods (14.60%)**, and **Household (11.32%)** — collectively contribute **40.74% of total sales**. This concentration means the performance of a small number of major categories has a disproportionate impact on overall revenue. Maintaining strong inventory availability in these categories is critical to protecting BlinkIT's revenue base.

Low-contribution categories like Seafood (0.76%) should not be eliminated based on sales alone — strategic importance and customer demand must also be considered.

CUSTOMER SATISFACTION

Customer Satisfaction vs. Sales Performance

Customer ratings and sales performance do **not** move proportionally — the highest-rated products are not necessarily the highest-selling ones. These two dimensions should be evaluated independently when making assortment and promotional decisions.

Highest-Rated Category: Meat — 4.02

Despite the best rating, Meat generates only **0.06 million** in sales — far below top sellers. High satisfaction does not guarantee high volume.

Highest-Selling Categories: F&V & Snack Foods — 0.18M Each

These categories lead in revenue but carry ratings of **3.96** and **3.95** — below Meat's 4.02. Volume and satisfaction are independent drivers.

Lowest-Rated Category: Breads — 3.88

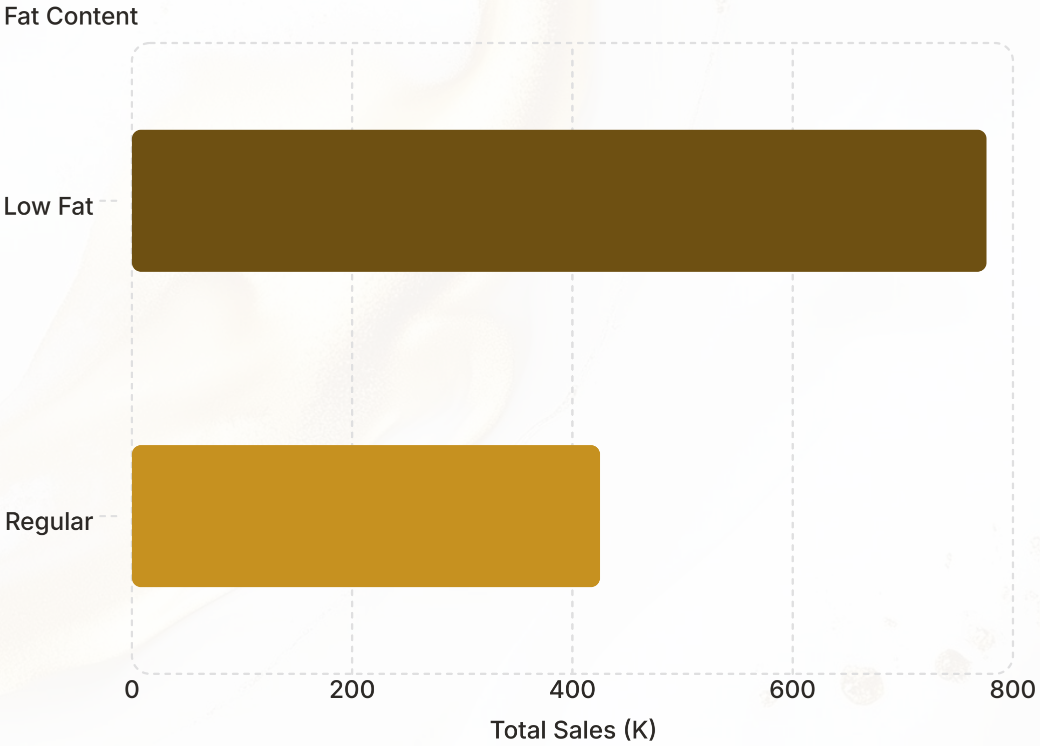
Breads records the lowest rating in the dataset. This signals a potential quality, assortment, or customer-experience issue requiring investigation.

Highest-Rated Outlet: Grocery Stores — 3.99

Grocery Stores achieve the best outlet rating despite generating only **0.15 million** in sales — far below Supermarket Type 1's **0.79 million**.

FAT CONTENT ANALYSIS

Low Fat Products Generate Higher Sales



Low Fat Outperforms Regular Across Every Segment

Low Fat products generate **0.78 million** in sales — nearly double Regular products at **0.43 million**. The gap is driven by item volume: **5,517 Low Fat items** vs. **3,006 Regular items**.

Both categories share an identical average rating of **3.97**, confirming that customer satisfaction does not differ meaningfully by fat content.

Low Fat dominance is consistent across all outlet types, with the largest gap in **Supermarket Type 1 — 0.51 million** (Low Fat) vs. **0.28 million** (Regular).

Regular products still generate 0.43 million in sales and achieve higher average sales in several outlet types — maintain adequate Regular product availability alongside Low Fat prioritization.

KEY TAKEAWAYS

Strategic Recommendations

1. ### Prioritize Volume-Rich Segments

Supermarket Type 1, Tier 3 locations, Medium-sized outlets, and 2018-established outlets drive the highest sales through item volume — not higher per-item averages. Focus inventory planning accordingly.

2. ### Protect the Top Three Categories

Fruits & Vegetables, Snack Foods, and Household contribute **40.74% of total sales**. Ensure strong availability and consider targeted promotions to protect this revenue base.

3. ### Monitor Satisfaction and Sales Separately

Meat leads in rating (4.02) but trails in sales. Use Grocery Stores' **3.99 rating** as a benchmark and investigate Breads (**3.88**) for quality or assortment improvements.

4. ### Prioritize Low Fat Availability

Low Fat products generate **0.78 million** vs. Regular's **0.43 million**. Prioritize Low Fat inventory, especially in Supermarket Type 1, while maintaining Regular availability.

5. ### Adopt Segment-Specific Strategies

Avoid one-size-fits-all approaches. Tailor inventory, assortment, and experience strategies by outlet type, location tier, product category, and customer demand patterns.
